The base of Autodesk Design Review: Autodesk Design Review was an implementation of Design Review API and technology. Design Review was the first client/server CAD software package which connected CAD systems at the AutoCAD level. Its main difference to other CAD systems such as AutoCAD was that it brought objectivity to CAD drafting. Autodesk had also been releasing Design Review add-ons which implemented various add-on functionalities including Rapid Visual Programming, an Autodesk plugin for Rhino According to the Autodesk blog, Autodesk acquired Design Review in 2007 and shut down the last Autodesk Design Review sites in 2013. Autodesk Design Review was based on an older programming interface called Design Review API. A Design Review API is a software program interface for AUTOCAD that communicates with the Design Review Application. The interface provides CAD users with the ability to automate CAD drawing processes. The latest version of the Design Review API is version 7. APIs and programming languages Several of Autodesk's applications have their own programming interfaces, but others have been developed to complement third-party API products. Scripting languages AutoCAD has historically supported the use of a wide variety of scripting languages including, but not limited to, AutoLISP and Visual LISP. Visual LISP is a variant of LISP that is implemented as a visual interface to the language. AutoCAD uses Visual LISP as its primary scripting language, while AutoLISP is used for automating or extending the program itself. Since version 2011, AutoLISP is deprecated in AutoCAD, and all of AutoLISP's functionality has been moved into Visual LISP. Visual LISP has since been deprecated in AutoCAD, and has been replaced with Python scripting support. As of AutoCAD 2008, a sub-set of Visual LISP was also added to Autodesk Inventor. Since Autodesk Inventor version 2013, Python scripting is also implemented for Autodesk Inventor. The Python scripting language has been added to other Autodesk applications such as Autodesk Fuse, Autodesk Dynamo, Autodesk Revit, Autodesk Architectural Design, Autodesk Architectural Design Live, Autodesk Plant Design and Autodesk Inventor. Fibrinolysis during rotational atherectomy. To elucidate the impact of rotational atherectomy on coagulation in the coronary circulation, 50 patients undergoing coronary angioplasty by rotational atherectomy were prospectively studied. The volume of coronary circulation sampled with a high-fidelity micro-pressure-tipped transducer catheter was compared with the coagulation parameters thromboelastogram (TEG) and thromboelastography (TEG). Collateral flow and clinical status were also analyzed. Procedural success was achieved in 48 patients (96%) without distal embolization, and the device was removed without any major complication in 47 patients (94%). TEG revealed an increase in alpha-angle (36.9 +/- 6.6 degrees to 40.6 +/- 9.5 degrees; $p = 0.001$), maximum amplitude (6.7 +/- 2.5 mm to 7.2 +/- 2.7 mm; $p = 0.004$), and area (127.6 +/- 54.4 mm(2) to 136.3 +/- 60.6 mm(2); $p = 0.005$), but a decrease in maximum clot strength (86.2 +/- 23.9 mm to 82.4 +/- 24.1 mm; $p = 0.04$) during rotational atherectomy. However, the volume of coronary circulation (123.2 +/- 41.4 ml to 122.9 +/- 43.5 ml; $p = NS$) and alpha-angle (37.3 +/- 10.2 degrees to 37.3 +/- 10.1 degrees; $p = NS$) were not significantly
